

Step-by-Step Visual and Endpoint Reference

Supporting attachment for YouTube's request for a complete visual reference of how the API Client uses YouTube API Services and the visible end results.

Reviewer package: one 90.20-second MP4 walkthrough recorded from a physical OPPO device, plus this endpoint and policy-boundary reference.

Company	SUPERMANDI TECH PRIVATE LIMITED
API Client	MoolSocial
Preferred contact	Dharmendra Choudhary - hello@moolsocial.com
Google Cloud project	moolsocial-dev-503018
Android package	com.moolsocial.app
Review build	youtube-compliance-followup-20260729-20
Physical device	OPPO CPH2375, Android 13
Evidence time	29 July 2026, 18:15-18:16 IST
Review APK	moolsocial-youtube-compliance-review-private-dev-r20.apk
APK SHA-256	641957A49AFC9F6A8D742CF71A4F22E65832F2443701BDB89F7C06BEE6EAC8FC
MP4 SHA-256	735029A8D4D46669388283C4A6093E8181CBFF17748EA1E6694B8BBE428CD8A6

Current demonstrated boundary

- Eligible public YouTube video discovery and returned public metadata.
- Official YouTube embedded playback initiated by a deliberate user tap.
- A bounded, YouTube-only Shorts lane with distinct eligible public items.
- A separately supervised read-only VetoNews channel connection.

Scope correction: the broad method selections in the original quota form included a staged roadmap. Uploads, viewer mutations, Analytics/Reporting and Live management are not active in this build and are not represented as working.

STEP 1

Discover eligible public videos

The recording starts on the source-attributed MoolSocial Videos library. The low-quota starting source is `videos.list(chart=mostPopular, regionCode=IN)`. `channels.list` enriches only the channel IDs returned with the selected items.

Physical-device result: real titles, thumbnails, channels, public metadata and visible YouTube source attribution.

End result: genuine public YouTube items appear in a clearly MoolSocial-owned catalogue. MoolSocial does not present this as YouTube Home or as YouTube's personalized recommendation feed.

STEP 2

Play one selected video

Selecting an eligible item mounts one official YouTube embedded player inside the OS-provided Android WebView. Playback begins only after the user taps the provider-owned play surface. YouTube branding, controls, advertising and links remain visible and unobstructed.

Official player cued before the user's deliberate play tap.

A genuine later frame in the same official YouTube player.

End result: YouTube-hosted audiovisual content plays through the official player. MoolSocial does not download, store, transcode or proxy the audiovisual content and does not place controls or commerce over it.

STEP 3

Open the bounded Shorts lane

The Shorts lane uses bounded, quota-sensitive **search.list** candidate discovery followed by **videos.list** metadata hydration. An item is admitted only when it is public, processed, embeddable and available in India; creator-declared metadata and the returned duration support the lane classification. Duration alone is not treated as proof.

First selected public Short, cued before playback.

The same Short playing in the official YouTube player.

End result: an eligible public Short plays in the official YouTube player. The lane is a bounded MoolSocial selection and is not described as access to YouTube's native Shorts recommendation feed.

STEP 3, CONTINUED

Change item and inspect public details

A vertical user gesture releases the previous selection and moves to a different eligible public Short. The details surface shows only returned public metadata and explicitly states that playback uses the official YouTube player.

A distinct next Short remains cued until the user taps play.

Public title, channel, views and likes with provider disclosure.

End result: the reviewer can verify the distinct item, its YouTube source identity and the separation between the official player and MoolSocial-owned Save, Discuss, Share and Details actions.

Read-only VetoNews channel connection

The owner-channel authorization is a separate supervised private-Dev flow, dated 26 July 2026, and is not presented as part of the continuous public-playback recording. MoolSocial sign-in and YouTube authorization remain separate. The OAuth flow uses the system browser and the narrow **youtube.readonly** scope.

Standard Google system-browser step showing the founder-controlled VetoNews identity used for the supervised connection.

Authorized identity	vetonewslive@gmail.com
Selected channel	VetoNews
Channel ID	UC7rn0BIzhULpyw1NYXh-mWQ
Scope	youtube.readonly
Result	Backend exact-channel reconciliation completed; refresh credentials remain server-side.

Return boundary: the app return route contains no OAuth code, state, access token, refresh token, email address, channel ID or internal MoolSocial user ID. Backend connection status remains authoritative.

Exact current API Client boundary

Visible journey	Operation or provider surface	Current status
Videos starting library	videos.list(chart=mostPopular, regionCode=IN)	Active and shown in MP4
Public details and eligibility	videos.list returned metadata	Active and shown in MP4
Channel enrichment	channels.list for returned channel IDs	Active and visible
Bounded Shorts candidates	search.list, followed by videos.list hydration	Active and shown in MP4
Video and Shorts playback	Official YouTube embedded player	Active on physical OPPO
Owner channel connection	OAuth 2.0 system browser, youtube.readonly, exact-channel reconciliation	Separate dated proof
Browser-to-app return	OAuth callback plus token-free MoolSocial deep link	Device-proven separately
Uploads and viewer mutations	videos.insert; Like/Comment/Subscribe or playlist mutations	Not active; not claimed
Analytics, Reporting and Live	Owner-authorized analytics/reporting/live resources	Not active; not claimed

How the original form is reconciled

The original method inventory described a staged production roadmap as well as the implemented slice. The email asks YouTube to assess this demonstrated current boundary and to advise whether the form should be replaced with a narrower current-method inventory before the quota decision. Future capabilities will be submitted only after they are implemented, consented, quota-modelled and reviewable.

No overclaim: this package does not claim public uploads, YouTube viewer mutations, owner analytics, reporting, live management, Production approval, or an unlimited/global YouTube catalogue.

Playback integrity and independent value

Player integrity	No MoolSocial overlay, frame, commerce control or gesture interceptor obscures any official YouTube player pixel or control.
User choice	Playback is initiated by a deliberate user tap. MoolSocial does not reward, coerce or compensate a user for watching.
Provider content	MoolSocial does not download YouTube video or audio, offer background play, suppress advertising, or replace provider links.
Commerce separation	MoolSocial advertising or commerce does not appear inside or over the YouTube player. Any separate native content must provide independent value or a real disclosed campaign relationship.
Independent value	MoolSocial is a broader AI-enabled social-commerce application. YouTube surfaces are source-attributed provider experiences within the larger customer journey, not a clone of YouTube.
Data clarity	YouTube-returned public metadata is labelled by source and is not merged into an invented cross-platform metric or suitability score.

Reviewer sequence

- Open the MP4 and verify the project, package, build and physical device on the title card.
- Observe API-backed public discovery and YouTube source attribution.
- Observe user-initiated official video playback with provider controls unobstructed.
- Observe the bounded Shorts lane, a distinct next item and returned public details.
- Use this PDF for the exact endpoint mapping, separate OAuth proof and out-of-scope boundary.
